

Between two core switches

Overview

To establish a VSX relationship between the core switches, create a link aggregation (LAG) interface for assignment as the VSX data plane's inter-switch link (ISL). The LAG can be defined at the Central UI group level when using the same ports for the VSX ISL on both core switches. We have two 4507s at our core, running HSRP.

Introduction: The Hierarchical Network Model In today's complex IT environments, network design follows a structured approach to ensure. A core switch in networking serves as the high-capacity backbone, centralizing data flow and ensuring efficient communication between different network segments.
