

Cables and fiber optic cables can be laid in conduits

Overview

A conduit is a protective tube or channel that houses the fiber optic cables, shielding them from moisture, dust, physical stress, and other environmental factors. It also facilitates cable management and ease of maintenance. The conduit protects the fragile fiber optic cables from environmental factors and physical damage, ensuring their longevity and optimal. Based on installation methods, outdoor fiber optic cables are categorized as follows: Underground fiber cables are generally pulled within a conduit that is buried underground, usually 1 to 2 meters deep, to reduce the possibility of being dug up. 2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. In extreme cold climates, cables may need to be buried at greater depths where there temperatures are colder and frost penetrates to. Whether you're setting up a network in your home or installing fiber optic cables for a large-scale project, one crucial factor to consider is the conduit.
