

# Can an optical splitter be connected to the downlink optical port of an FTTR

## Overview

The FTTR master gateway is connected to the OLT in the uplink, and connected to multiple slave optical routers in the downlink through optical fibers and optical splitters. Furthermore, the main ONT includes standard GE and POTS interfaces and supports the WiFi standard. The optical router supports Gigabit Ethernet ports and Wi-Fi 6, and enters each room through optical fibers to realize wired. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. The PEN passive aggregation module, also known as passive optical splitter or passive multiplexer, splits and multiplexes optical signals. Conversely, it can also combine multiple signals into one. Its primary role is in Passive Optical Networks (PON), which are the foundation of.
