Widely deployed across the world's largest and most demanding networks, Nokia optical Data Center Interconnect (DCI) solutions empower leading hyperscalers, communications service providers (CSPs), cloud providers and enterprises to deliver massive interconnect capacity with exceptional. Data center interconnect (DCI for short) connects two or more isolated data centers for mutually reliable and efficient data transmission. Traditional DCI uses direct fiber connection between single ports. Currently, the data volume of each data center is huge, and optical fiber resources between. Abstract: We propose and experimentally demonstrate an all-optical architecture for data center interconnect networks with reconfiguration times of a few seconds. Filtering and amplification transient effects have minimal impact on BER performance. The solution simplifies transport between data centers by replacing stand-alone optical. Juniper Networks DCI solution combines end-to-end packet optical networking platforms with unified management and control software and open APIs, helping providers simplify operations, reduce TCO, and accelerate capacity expansion. It connects multiple data centers through high-speed optical links.
