

Fiber optic cables can be routed through power line wells

Overview

They have a unique construction that allows them to be installed on existing power line towers or poles without the need for additional hardware or supports. Utilities began using fiber optics almost as soon as it became available. It was used anywhere communications were needed near power equipment, such as substations or control. Besides traditional cables lashed to messengers, figure-8 cables or ADSS cables, utilities can construct transmission links using optical ground wire (OPGW) or optical power phase conductor (OPPC), cables which include both fiber and metallic conductors, or optical power attached cable (OPAC) which. ADSS fiber optic cable is designed for aerial installations, particularly in high voltage environments. The all-dielectric design eliminates. Electric utilities seeking to increase their fiber connectivity have historically looked up, installing optical ground wire (OPGW) overhead in their transmission rights-of-way (ROWs). Obviously, these fiber cables need to be resistant to electricity, which can be difficult as many aerial cables contain high tensile steel (HTS) for tensile strength.
