

Green and blue wiring in the distribution box

Overview

Wire color: The neutral wire is blue, and the color of the phase wire (A phase is yellow, B phase is green, and C phase is red) should meet the standard. The wiring color codes are the standard safety language of electricity. They make it easy to identify immediately which wires are live, neutral, or grounded (avoiding costly mistakes and hazardous accidents). Using the correct wiring color codes is crucial for identifying line, neutral, and ground wires, which saves time, simplifies maintenance and troubleshooting, and ensures the safety of. For a typical IEC-colored single-phase LED fixture, brown means line or live, blue means neutral, and green-yellow means protective earth/ground. On a common US 120V circuit, that usually maps to brown-to-black, blue-to-white, and green-yellow-to-green or bare ground. The lighting and socket circuits generally use. **WARNING:** Please be aware that the table below is a guide; a wire should never be identified by color alone. Before handling any wire, always rely on testing with professional tools, not assumptions.
