

How many degrees should the pigtail be bent

Overview

Pigtail should be no more than 3/4" long and have a minimum of four (4) twists. External chain design is another topic, but if you want background on the panel-mount side, the SMA feedthrough guide provides a solid foundation. NOTE The length of pigtail at the twisted end should be 1/4 to 1/2 inch, or 3 to 6 turns. This pigtail shall be bent back or under to prevent it from becoming a snag. The double-twist method is the most common method of securing with lockwire. Examples of this method are shown. For residential 15-amp circuits, 14 American Wire Gauge (AWG) wire is typically used, while 20-amp circuits require 12 AWG wire to handle the higher current safely. Approved connectors, such as twist-on wire nuts or push-in connectors, must also be on hand, ensuring they are correctly sized to. Lockwire for use up to 700°F must be a corrosion resistant steel such as AMS-5685. It uses a short conductor to bundle several source wires into a single secure joint. Pigtail creates organized junctions that:
