

Linking process between optical modules and switches

Overview

Optical modules and switches, as core network hardware, form a closely interdependent and symbiotic relationship—optical modules are the "extension arms" of switches that overcome transmission limitations, while switches are the "command center" for optical modules to function. Their cooperation is. Co-Packaged Optics (CPO) is an optoelectronic co-packaging technology that integrates an optical module (responsible for optical signal transmission and reception) and a switch ASIC (responsible for electrical signal processing) into the same physical package. Unlike traditional pluggable optical. Its main function is to convert between electrical and optical signals during optical signal transmission. Figure 20-30 shows how an optical module works. These compact yet powerful devices serve as the bridge between electrical. This paper first summarizes the topologies and traffic characteristics in data centers and analyzes the reasons and importance of moving to optical switching.
