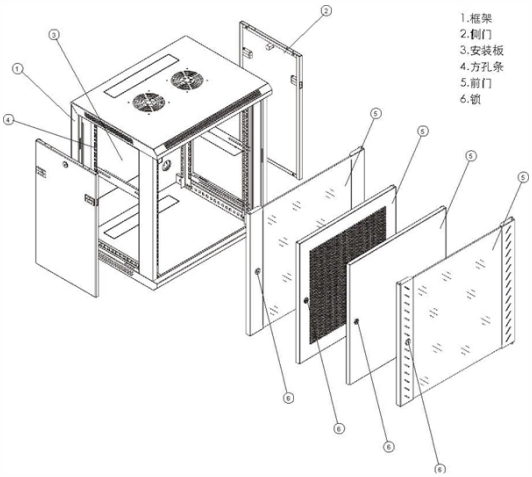
# Network Security Equipment Management Log



## Overview

The Logs section provides the tools to view the system logs, authentication logs and auditing logs as well as download the logs in CSV format. Firewall logs can be used by the administrator for troubleshooting network. You can access the system logs by. A security information and event management (SIEM) solution ensures a healthy security posture for an organization's network by monitoring different types of data from the network. Think of logs as breadcrumbs that show everything happening across your routers, switches, firewalls, and other network infrastructure. This includes considerations for configuring the logging settings for different policies, the configuration of local log storage databases, and setting both local logging for the Firewall. A log is an automatically generated, time-stamped file that provides an audit trail for system events on the firewall or network traffic events that the firewall monitors. In this comprehensive guide, we will cover the key concepts, tools, and techniques for analyzing log. Alternate format: Network security logging and monitoring - ITSAP.
