

Optical Wavelength Division Multiplexing Technology Transmission Method

Overview

Normal WDM (sometimes called BWDM) uses the two normal wavelengths 1310 and 1550 nm on one fiber. Dense WDM (DWDM) uses the C-Band (1530 nm-1565 nm) transmission window but with. In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i. This guide delves into the principles, types, applications, and future trends of WDM. The "basie" transmission rate of SONET is 64 kbps for supporting voice communications. SONET multiplexes large numbers of 64-kbps channels onto higher-rate datastreams. SONET defines a. Optical multiplexing is the art of combining multiple optical signals into one to make full use of the immense bandwidth potential of an optical channel. It can perform additional roles like providing redundancy, supporting advanced topologies, reducing hardware and cost, etc.
