

Potential Hazards of Corrosion in Distribution Boxes

Overview

While many factors can contribute to corrosion, there are three primary causes: poor ventilation, high temperatures, and electrolytic action. Inadequate ventilation can occur when corrosion-prone metals are enclosed such that airflow is prevented from reaching it. While isolating external moisture is Powbinet's primary task, an overly tight structure can lead to internal heat buildup, a physical phenomenon that can actually cause equipment malfunctions. Since electrical. Corroding metals and associated corrosion products in finished water can react with disinfectants, causing areas of low disinfectant residual in the distribution system. Maintaining the structural integrity of the steel enclosures essentially depends on the precise matching of the material's metallurgical. It is designed for use by suppliers, installers, inspectors, and users of electrical products. Therefore, certain measures should be taken to prevent the distribution box from corrosion.
