

Seal the opening in the distribution box

Overview

Place the box in the hole and insert the pipe at least one inch inside the box. Cut the corrugated pipe to receive an American Dial-A-Flow™. Compress the first three pipe corrugations and insert the pipe into the box, seal and lock the pipe and seal at first. Inlet and outlet elevations are positioned to provide equal distribution and meet most local codes. The groove contours of electronic distribution boxes and the very narrow grooves of micro-distribution housings are seamlessly sealed with the sealing foams of the polyurethane-based FERMAPOR K31 or the silicone-based FERMASIL product families. Polylok risers fit seamlessly and are available in two heights - 150mm (6") or 300mm (12") - please ask for more information. The built in spare capacity makes it easy to open up the seal and change or add cables, without punching new holes or adding material, whenever there is a need. Roxtec seals have large openings. This article explains why sealing matters, the materials and methods to use, and a step-by-step guide to get it right.
