

Secondary distribution box with bracket

Overview

Typically composed of a durable metal frame or bracket, Secondary Racks are designed to be securely mounted onto utility poles or structures. They feature multiple attachment points or slots that allow for the tidy and efficient routing of secondary conductors along the pole or structure. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. A feeder usually begins with a feeder breaker at the distribution substation. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. The SDB can be fitted with terminal blocks for custom. ACS takes the basic idea of zone wiring and combines it with pre-cut, pre-tested cable and plug-in connectors, to provide power and telecommunication systems that can be installed under raised floors (The Intelligent Floor), or in accessible ceilings (The Intelligent Ceiling).
