

Sicso monitors PoE switches

Overview

The Catalyst Center Power over Ethernet (PoE) enables you to monitor the PoE-capable devices in your network. It also monitors the power summary of switches supplying PoE, which provides information such as a switch's power budget, used power, remaining power, and power usage. Power monitoring, also known as power sensing, is the process in which a PoE-capable switch monitors the real-time power consumption of a powered device. Power monitoring works with Cisco intelligent power management and CDP-based power consumption features to ensure that the PoE port can supply. Power over Ethernet (PoE) allows a single Ethernet cable to carry both power and data to devices such as IP phones, wireless access points, and surveillance cameras. PoE also lets you. The IEEE 802.3at. Endspan: network switch with PoE capabilities. Allows non-PoE devices to benefit from PoE by providing separate connections for data and power.
