

# Use DAC between optical switches

## Overview

A DAC cable is a pre-terminated copper twinax cable with factory-attached transceiver ends — usually in SFP+, QSFP+, QSFP28, or QSFP-DD form factors. It provides an electrical connection between ports, eliminating the need for separate optical transceivers and patch cords. Direct Attach Cable (DAC) vs Active Optical Cable (AOC): Which One Should You Use?

DAC uses twinax copper for ultra-short, low-power links (<3 m), while AOC uses optical fiber for longer distances (up to 100 m) with better flexibility and EMI immunity. However, ensuring compatibility is key to performance and stability. Copper has a length or reach limitation of less than 5 meters and two different optical technologies enable using different technologies for the least cost to fit the application. While transceivers and patch. Direct attach copper (DAC) cables are designed to work with fiber optic networks.
