

# What is the normal current draw of an optical module

## Overview

Below 180mA, according to the working principle of optical module, normal 1. However, with the increasing use of time limit, many of the old module operating current will be. SFP (Small Form-factor Pluggable) optical modules are compact, hot-pluggable transceivers that enable network equipment to connect seamlessly to fiber and copper links. These modules, including SFP, SFP+, and SFP28, are widely used in enterprise networks, data centers, and carrier-grade deployments. The optical power output of an SFP module refers to the amount of light power that the module can transmit over a fiber optic link. This is typically measured in dBm (decibels relative to one milliwatt) and is a crucial factor in determining the reach and quality of the optical signal. It transforms high volumes of electrical signals into optical signals for transmission. This guide provides average transmit and receive power ranges for transceiver modules.
